### **Safety Precaution**

### We appreciate your purchasing video server. Before installing the product, please read the following with care.

- ♦ Make sure to turn off the power before installing video server.
- $\diamond$  Do not install under the direct sunlight or in dusty areas.
- ♦ Make sure to use the product within the temperature and humidity specified in the specification.
- ♦ Do not operate the product in presence of vibrations or strong magnetic fields.
- ♦ Do not put electrically conducting materials in the ventilation hole.
- ♦ Do not open the top cover of the products. It may cause a failure or electric shock on the components.
- ♦ To prevent from overheating, make sure to keep the distance at least 10cm from the ventilation hole.
- ♦ Make sure to check the proper voltage before connecting the power.

### 1. Introduction

#### About this manual

This User Manual provides information on installation setup and operation of the video server, as well as how to manage troubleshooting.

#### Features

A Video server is a video and audio transmission system that provides broadcast quality audio and video, based on IP network through LAN and ADSL/VDSL. Video server operates in an Encoder mode. Encoder system compresses media data and transmits them.

#### <u>Video</u>

- Up to 3840 x 2160p60
- Highly efficient compression algorithm, H.265 / H.264 / MJPEG support
- Wide range of transmission rates: 32kbps ~ 16Mbps
- Various transmission modes: CBR, VBR, Hybrid
- Motion detection

#### <u>Audio</u>

- Multi-Transmission Mode : Unidirectional Mode (IP-server to Client PC or Decoder / Client PC or Decoder to IP-server), Bi-directional Mode

#### <u>Network</u>

- Fixed IP & Dynamic IP (DHCP) support
- 1:1, 1:N support
- Multicasting
- MPEG-TS
- SRT (Secure Reliable Transport)
- Automatic transmit rate control according to network conditions
- OnVIF, PSIA compliant

#### Serial Data

- RS-232/422/485 support
- Data pass-through mode : Serial data communication between IP camera and Decoder
- Data pass-through mode : Serial data communication between Encoder Decoder

#### Sensor and Alarm

- Support direct connections of external sensor and alarm devices
- Event Alarm

#### <u>USB</u>

- Connection to internal or external USB storage for remote access, recording and playback

#### User Interface

- Diagnose and upgrade through dedicated program called True Manager
- System configuration using web browser

#### High Reliability

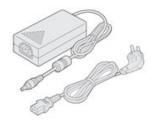

- Reliable embedded system
- System recovery by dual watch-dog functions

#### **Product and Accessories**

Video Server

Power Adapter and Cable

Screws

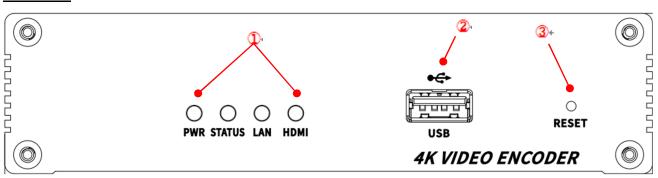

Brackets

ANT-39000 4Kp60 Video Server User Manual

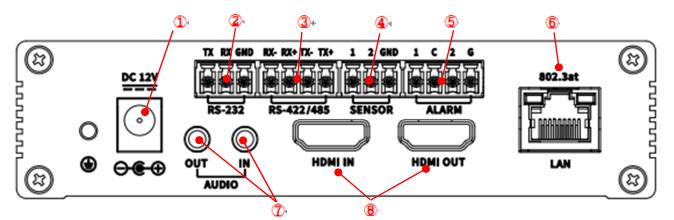

#### Part Names and Functions

#### Front View

No.	Parts	Function
1	LED	Display system status
2	USB Port	USB Recording
3	Reset	Manually Reset

#### **Rear View**

No.	Part	Function
1	Power	DC +12V power input
2	RS-232	Serial port for PTZ control and etc
3	RS-422/485	Serial port for PTZ control and etc
4	Sensor	Sensor input
5	Alarm	Alarm or Relay Output
6	LAN (Master, Slave)	1000/100/10-base-T Ethernet
	LAN (Master, Slave)	Only master port supports PoE
7	Audio In/Out	Audio in/out
8	HDMI In/Out	HDMI In/Out

last saved: 16-Jun-23

#### System Connections

Video server operates as one mode; Encoder. Video server can be connected in either 1-to-1 fashion where one encoder is connected one decoder or 1-to-many fashion where one encoder connected to many decoders.

Following chart shows data status of video, audio and serial data.

System Mode	Video	Audio	Serial Data
Encoder	Transmit	Transmit/Receive	Transmit/Receive

The system mode is defined by the video communication and the system mode is capable of single directional transmission of audio and bi-directional of serial data.

#### <u>Topology</u>

Generally, the encoder and a decoder are connected in 1-to-1 mode. To support specific situation, 1-to-multiple connection is also supported.

#### • 1:1 Connection (Unidirectional Transmission).

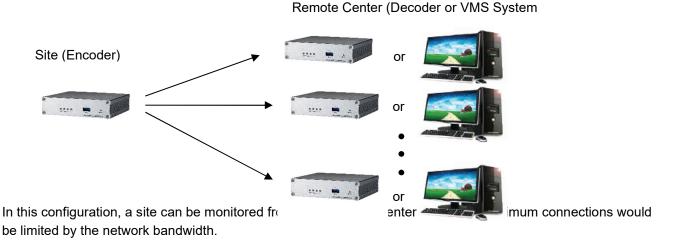

The most commonly used configuration is 1 to 1 connection. An encoder is installed at a site where video images can be transmitted and a decoder is installed at a center location to receive and view the video images on monitors. Audio and serial data are transferred in either direction.

A decoder and encoder can be connected by setting of the encoder's address at the decoder's remote IP.

#### • 1:N Connection (Unidirectional Transmission).

Functionally, the VMS (Video Management System) software can be replaced as the decoder.

#### Multicast Mode

In the network supporting multicast mode, if **Multicast** is setup as a system protocol, you can use bandwidth efficiently regardless of the number of decoders. In 1:N connection, a large number of decoders can receive audio and video data from an encoder by using a single streaming transmission.

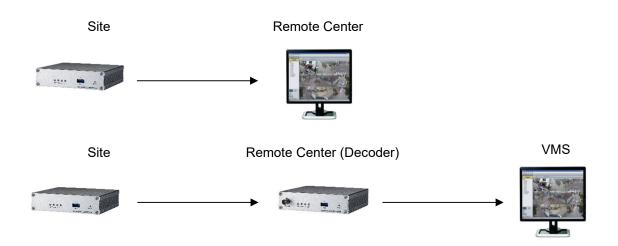

#### Relaying

In this arrangement, video and audio can be retransmitted from a center to another center. The arrangement is useful when the network bandwidth at the site is limited while there is more than one center wanting to monitor the site.

#### • VMS(Video Management System)

VMS (Video Management System) that supports Onvif is a Windows based remote monitoring program to access multiple encoders for real-time monitoring or control of the encoders and connected cameras.

### 2. Installation

#### **Connecting Video**

#### - Encoder system mode

Connect camera or other video source such as computer's video output line to the encoder (video server) video input port. HDMI cable ver. is 2.2.

#### **Connecting Audio**

It is possible to set the mode as Tx-only, Rx-only, Tx-Rx or audio off.

- Connect audio input and output ports to audio devices accordingly.
- The Audio signal required is line level, so audio equipment with an amp, mixer or other amplifier should be used.
- Embedded audio over HDMI is supported.

#### **Connecting Serial Ports**

For camera control, PTZ controller (keyboard) and receiver can be connected to serial ports. Two
corresponding serial ports in encoder and decoder which are connected in 1-to-1 fashion works in passthrough mode. This means that commands at a local system's COM1 port will be transparently passed to
the remote system's COM1 port. Also, a command at a local system COM2 port will pass to the remote
system's COM2 port.

#### **Connecting Sensor and Alarm**

- Connect sensor and alarm devices to corresponding terminals accordingly.

#### **Connecting Power**

- After confirming the power source, connect power adaptor and connect the 12VDC connector to the system.
- Also PoE (Power over Ethernet) is supported.

#### Check if it Works

 Once the power is supplied to the camera, it will start booting. The system will boot up to an operating mode after approximately 40-60 seconds. The green LED on the Ethernet port will flash indicating the system is ready. Software called True Manager allows you to check the IP address and other network details of the camera. Please refer to the True Manager manual for instructions on how to find the IP address of the camera and if required changing it.

ł

#### Front LED display and button

#### - Description of LED

PWR STATUS LAN HDMI

#### $\bigcirc$ System status can be monitored with LED display

LED	State	Description
ם/אום	Off	Power off
PWR	Green	Power on
STATUS	Green blinking	Normally operating
STATUS	Red	System failure: Needs diagnostics
	Off	No LAN connection
LAN	Green	LAN Connected
	Green	HDMI Connected
HDMI (Encoder)	Red	HDMI Connection failure
(Encoder)	Off	No HDMI connection

#### - USB 3.0: USB Recording

- Reset button
  - 1. While the system is in operation, press the reset button for more than 10 seconds.
  - 2. The system will reboot automatically.
  - 3. Once the system reboots, IP address will be set to the system default as below;

• IP mode	Fixed IP	• IP address	192.168.10.100
Subnet mask	255.255.255.0	Gateway	192.168.10.1
Base port	2222	HTTP port	80

### 3. System Operation

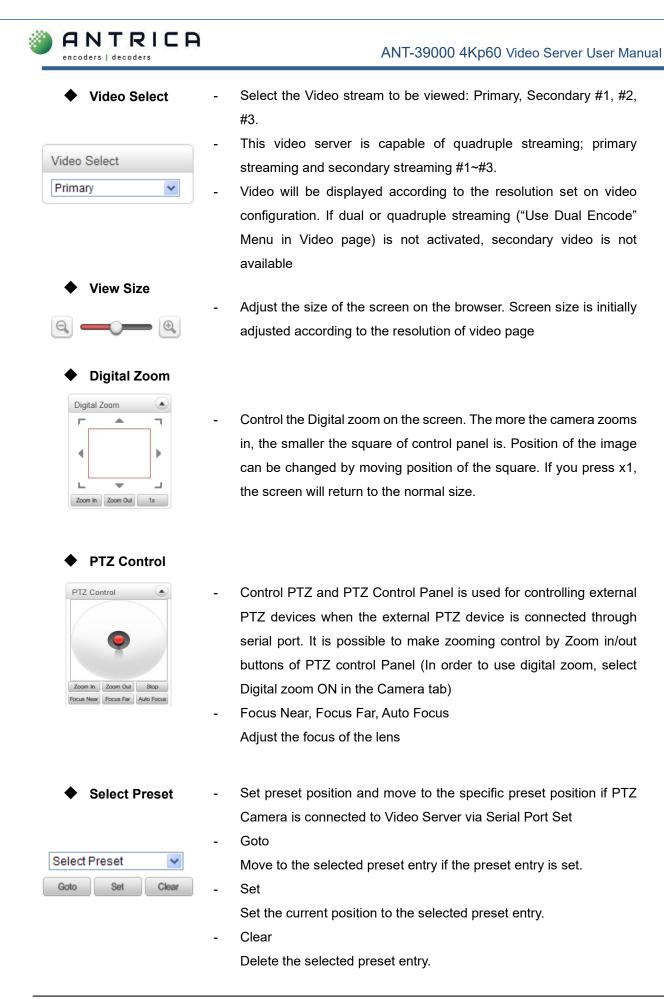

#### **Remote Video Monitoring**

- There are two ways to monitor video when the center system and IP camera are connected. In order for a
  proper operation, an IP address must be set accordingly. Default password is requested modification for
  better security. Please refer to True Manager program for further details.
  - > Default ID : admin
  - > Default Password :1234

#### Video Monitoring using Google Chrome

- Open Google Chrome and enter camera's IP address. Once authorized, Google Chrome will start to display video images from camera as shown below.

	$\triangleright$	Default IP Address : http://192.168.10.100	
S Video Surveillance	× +		✓ – Ø X
<ul> <li></li></ul>		<complex-block></complex-block>	

Select List Pattern, Swing, Group can be activated as configured PTZ Page. Select List  $\mathbf{v}$ Group Pattern Sensor Input and Alarm Output Display the status of the sensor in real time. When the sensor of the video server is working, the sensor light turns red and you can operate the alarm device by pressing the number icon. A number icon indicates status of the alarm device. Snapshot Capture video images and store them as BMP or JPEG files. 0 Talk Transfer audio from PC's mic to the camera **File Record** Recording to an AVI file on Live View page is available. AVI files are generated in the specified folder or in a specified file name on the PC where web browser is running. File Record . 1. Press "Set" button to select a folder or create a new folder. Enter Folder C:\Docume Set the file name on a filename field. Filename 2. Press "Start" button to start recording. Start 3. Press "Stop" button to stop recording. 4. An AVI file named "IP address\_hh\_mm\_ss" or "File name\_IP address\_hh\_mm\_ss" will be generated in the specified folder depending where specified folder on the path or a prefix of the file name. **Display Buffer** Set the number of video frames to be buffered before being displayed on web browser. Larger value results in smoother video by sacrificing the latency. A setting of 10 ~ 15 frames can be used

generally for most situations

#### Initialize of IP Address

If a system IP address is lost, the system can be reset to the system default IP address using the reset button in the back side of the system.

- 4. While the system is in operation, press the reset button for more than 10 seconds.
- 5. The system will reboot automatically.
- 6. Once the system reboots, IP address will be set to the system default as below;

• IP mode	Fixed IP	• IP address	192.168.10.100
<ul> <li>Subnet mask</li> </ul>	255.255.255.0	Gateway	192.168.10.1
Base port	2222	HTTP port	80

### 7. Remote Configuration

#### **Using Web Browser**

Remote setting is available by using web browser. Enter the IP address of Video Server and a live view screen will appear as below. Press **Setup** button located in the upper right area of the monitoring screen to go to the server setup. For Remote Setting, user should be authorized higher than manager level.

د الله: //192.168.152.147/user/view.html - د

#### - Performance Calculation

This calculation shows the performance usage rate according to the value set

- Input Format

Choose the input format from the list that is matched to the output of the camera or other video source.

#### - Video Input Auto Detect

Full Auto provides fixed resolution as input format. When semi auto is enabled, user can select resolution.

#### - Detected Format

Source and video information are shown and whether it is connected to the Encoder

#### - Algorithm

Select compression algorithm. Note that MJPEG is supported only for Secondary streams.

#### - Resolution

#### Select video encoding resolution.

**Scaling** option is used when encoding resolution is different from input resolution. Without Scaling option, input video will be cut according to encoding resolution. On the other hand, if Scaling is selected, input video will be adjusted according to the encoding resolution.

#### - Framerate

Determine the maximum number of frames per second for the video stream. 1,2,3,4,5,6,8,10,15,20,25,30 and 60 frame rate can be selected. The actual frame rate of the video can be less than the maximum frame rate set due to the network bandwidth limitation

#### - Preference

Select encoding mode to control video quality or bitrate: Quality(VBR) or Bit rate(CBR and Hybrid). If 'Bitrate' is selected, the video encoding will be affected by the 'Bitrate' value entered. Therefore, "Bitrate" mode corresponds to CBR (Constant Bit Rate) or Hybrid (Hybrid Constant Bit Rate) encoding. If 'Quality' is selected, the video encoded will be affected by the quality of image selected. Therefore, "Quality" mode corresponds to VBR (Variable Bit Rate) encoding.

#### - Quality

Select Video quality. 8 levels of quality are available.

Quality mode (VBR encoding) tries to encode every frame in a constant quality. Therefore, the resulting bitrate may vary a lot depending on the complexity or activity changes in the input video. It is preferred when constant video quality is required and network bandwidth is enough for delivering the stream of highly varying bitrate.

#### - Bitrate

Determine the bitrate value between 32 ~ 16Mbps.

Bitrate mode (CBR encoding) allows you to set a fixed target bitrate that consumes a predictable amount of bandwidth. In order to keep the bitrate limit, video quality is controlled dynamically according to the complexity or activity changes in the input video.

Bitrate mode (Hybrid encoding) allows you to set a maximum bitrate. Bitrate does not exceed the set bitrate but it can decrease automatically when the scene complexity is decreased. This mode allows you to control the bandwidth efficiently.

#### - I-Frame Interval

Determine I-frame Interval between 1 and 255.

#### H.264 Profile

#### Select H.264 Profile: High Profile or Baseline Profile

The standard defines various sets of capabilities which are referred to as profiles that target specific classes of application.

#### I. High Profile

The Primary profile for broadcast and disc storage applications are used particularly for highdefinition television application.

#### II. Main Profile

This profile is used for standard-definition digital TV broadcasts that use the MPEG-4 format as defined in the DVB standard.

#### III. Baseline Profile

Primarily used for low-cost applications that require additional data loss robustness, this profile is sometimes used in video conferencing and mobile application. This profile includes all features that are supported in the constrained baseline profile, plus three additional features that can be used for loss robustness.

#### Secondary #1 ~ #3

Primary Secondary#1 Secondary#2 Secondary#3	
Enable 🔿 Off 🖲 On	
Algorithm 💿 H.264 🔿 MJPEG 🔿 H.265	
Resolution 720x480 V Scaling	
Framerate 30 v	
Preference CBR v	
Quality Economy	
Bitrate 1024 kbps (32 ~ 4096)	
I-Frame Interval	30
H.264 Profile High Profile v	

#### - Use Quadruple Encode

Select **ON** to enable to use Secondary #1 ~ #3.

The Secondary #1 ~ #3 video can be viewed on **Live View** window by selecting **Stream number** on Video selection

#### - Algorithm

Select H.264 or MJPEG or H.265 for the secondary, tertiary or quaternary streaming. In case of H.264, wither bitrate mode or Quality mode can be selected for Preference mode. On the other hand, MJPEG supports **Quality** mode

#### <u>Audio</u>

💮 System 🔸				

#### - Audio Source

Select the audio source: Embedded or Analog stereo

#### - Algorithm

Select the audio algorithm: G.711 or AAC

G.711 and AAC from client to server direction are supported. Thus, bidirectional audio communication is supported.

#### - Sampling rate

The sampling rate defines the number of samples per unit of time taken from a continuous signal to make a discrete signal.

#### - Bitrate

Select the bitrate between 32Kbps and 192Kbps when AAC is selected

The sampling rate is fixed to 64KHz for G.711 and is 32KHz, 44.1KHz and 48KHz for AAC respectively. Note that when camera is connected to a decoder, the decoder's audio algorithm should be set identically to transmit audio properly.

#### - Mode

Select audio operation mode

Mode	Action
Off	No operation
Tx-Only	Transmit only
Rx-Only	Receive only
Tx & Rx	Transmit and Receive

#### - Input Gain

Set audio input gain from 0 to 31.

#### - Local

Select the IP mode: Fixed IP or DHCP Depending on the selected mode, further configuration items come as follows,

IP Mode	Selection	Description
	Local IP	Fixed IP address
Fixed IP	LocalGateway	Gateway IP address
	Local Subnet	Subnet mask
DHCP	N/A	

Please ask IP address information from ISP provider or network manager.

- DNS

#### > Obtain DNS server address automatically

Get DNS server address automatically when IP mode is DHCP.

> Use the following DNS server address

Enter the DNS server IP address; Primary or Secondary DNS server

**Domain Name System (DNS)** is a database system that translates a computer's fully qualified domain name into an IP address. Networked computers use IP addresses to locate and connect to each other, but IP addresses can be difficult for people to remember. For example, on the web, it's much easier to remember the domain name www.amazon.com than it is to remember its corresponding IP address (207.171.166.48). Each organization that maintains a computer network will have at least one server handling DNS queries. That server, called a name server, will hold a list of all the IP addresses within its network, plus a cache of IP addresses for recently accessed computers outside the network.

- IPv6

- > Ipv6 Address: Enter the designated Ipv6 address.
- > **Ipv6 Subnet Prefix Length:** Enter the bit number of Ipv6 Subnet
- > Ipv6 Default Gateway: Enter the designated Ipv6 gateway.
- > **Ipv6 Link Local:** Display Ipv6 Link Local.
- Port
- Base Port (1025~65535)

Enter the Base Port number

Network base port is used for communication with remote clients. In order for camera and remote systems to be connected, the port number must be identically configured in camera side and client side.

#### > HTTP Port (80, 1025~65535)

Enter HTTP port used for web-based connection.

#### > HTTPS Port (443, 1025~65535)

Enter HTTPS port used secured HTTP connection.

#### > RTSP Port (554, 1025~65535)

Enter RTSP port used for RTSP-based connection. The default TRSP port is 554.

**RTSP** (Real Time Streaming Protocol) is a standard for media streaming between server and client.

#### > Audio Receive Port

Enter Audio port used for audio transmission from client or other software. Default Audio Receive Port is 2280.

#### - MTU Size

MTU (Maximum Transmit Unit) is the size of the largest protocol data unit that can be communicated in a single network layer transaction. Default value is 1500.

#### - Multicast

The Multicast menu is used for configuring the multicast IP address to which media stream is delivered when a client such as a Decoder, VMS or NVR software is connected in multicast mode. The multicast IP address selection range is between 224.0.0.0 and 239.255.255.255. The selection can be used only when media protocol is set to Multicast.

#### **RTSP Multicast**

RTSP Multicast used to specify the multicast address to be used when the client requests RTSP multicast via ONVIF command.

- QoS (Quality of Service) guarantees a certain level of a specified resource to selected traffic on a network. A QoS-aware network prioritizes network traffic and provides greater network reliability by controlling the amount of bandwidth and application may use. Using DSCP (Differentiated Services Codepoint) values, Video Server can mark the following types of traffic: live video, event/alarm traffic and management traffic.

#### - UPNP

By the setting **UPNP** to ON, it allows the discovery by the client according to UPNP (Universal Plug and Play) protocol.

#### - Zeroconf

By setting **Zeroconf** to ON, it allows the discovery by the client according to zeroconf protocol.

#### - WS Discovery

Discovery function based on web service is enabled. It allows the discovery by the client SW which is supporting Onvif.

- Video Server provides two kinds of one-way (unidirectional) streaming based on UTP to clients; MPEG-TS and RTMP. Both are a kind of broadcasting where traffic from clients to a server is not generated at all.
- MPEG-TS is a standard format for transmission and storage of audio, video, and data, and is used in broadcast systems such as DVB and ATSC. Transport Stream is specified in MPEG-2 Part 1, Systems (formally known as ISO/IEC standard 13818-1 or ITU-T Rec. H.222.0). Transport stream specifies a container format encapsulating packetized elementary streams, with error correction and stream synchronization features for maintaining transmission integrity when the signal is degraded. As MPEG-TS itself supports only AAC as the audio algorithm, only video is streamed when audio algorithm is set to G.711.

#### - Related settings are as follows:

- **Destination IP :** Set the IP Address of the destination system which will receive MPEG-TS stream.
- **Destination Port :** Set the Port of the Destination system which will receive MPEG-TS stream.
- **RTMP (Real-Time Messaging Protocol)** is for streaming audio, video and data over internet between a Flash player and a server. (H.265 RTMP streaming is not supported)

last saved: 16-Jun-23

- > **Destination IP :** Set the IP Address of the destination system which will receive RTMP Stream.
- StreamName : Enter the streamname that will be used as session name
- **User Name :** Enter the user name that will be used as session name
- > **Password :** Enter the password that will be used as session name

#### SRT (Secure Reliable Transport).

- SRT is an open source project which is Video and Audio transmission protocol developed by SRT Alliance. SRT optimizes streaming performance across unpredictable networks, such as the Internet, by dynamically adapting to the real-time network conditions between transport endpoints.

This Setup is used for SNMP (Simple Network Management Protocol). It is compatible to both SNMPv1 and SNMPvec. Settings for using SNMP are as following;

#### - SNMP Listen Port (0, 161, 1025 ~ 65535)

The port is for connecting external device when system operates as a SNMP client. SNMP is not used by setting 0 value.

#### - SNMP Trap Destination IP

Set the SNMP Trap Destination IP.

#### SNMP Trap Destination Port (0, 162, 1025 ~ 65535)

Set the SNMP Trap Destination Port. SNMP is not used by setting 0 value.

**Simple Network Management Protocol (SNMP)** is used by network management systems to communicate with network elements. SNMP lets TCP/IP-based network management clients use a TCP/IP-based internetwork to exchange information about the configuration and status of nodes. SNMP can also generate trap messages used to report significant TCP/IP events asynchronously to interested clients. For example, a router could send a message if one of its redundant power supplies fails or a printer could send an SNMP trap when it is out of paper

#### - SNMP Version

Select SNMP Version 1, 2C or 3

#### DDNS

Select DDNS (Dynamic DNS) server to use. One of the two can be selected.

#### - TrueDNS

True DNS service is used in the mode. Systems can be registered on the website for True DNS service, <u>http://ns1.truecam.net</u>. A system will get a domain name of xxx.truecam.net. Please refer to user guide document for True DNS service.

#### - DynDNS

Dyn DNS service is used in this mode. Refer to <u>www.dyndns.org</u> for details. ID, Password and Domain name are needed when DYN DNS is set.

**Dynamic DNS** is a method, protocol, or network service that provides the capability for a networked device, such as a router or computer system using the Internet Protocol Suite, to notify a domain name server to change, in real time (ad-hoc) the active DNS configuration of its configured hostnames, addresses or other information stored in DNS.

#### Vdyn

Vdyn is a DDNS service provided by Visionica (<u>http://visionica.com</u>). No further configuration is required for using this service. It internally uses MAC address for the registration. When it succeeds, the domain name of the form 001C63A607EC.visionica.info is displayed on Current Domain entry of Network page. E-mail setting is not mandatory.

#### - Check IP Disable

If "Check IP Disable" is selected, it will skip to check its own IP. In fixed IP mode, the set IP will be registered on DDNS server. In DHCP mode, dynamically assigned IP will be registered on DDNS server. Normally **Check IP Disable** should be unchecked in order to obtain public IP in the network.

#### IP filtering

E-mail Specify the information to send event information, when E-mail is selected as an

event action.

#### Server Address

Enter an address of mail (SMTP) server

Port

Specify a port for SMTP operation (**Port 25 is the default port in SMTP operation**. If a different port is configured in the SMTP server, this ports needs to be changed accordingly.)

#### Sender Address

Enter an account registered in SMTP server.

#### > Authentication on SMTP server

This function is applicable when the E-mail server requires authentication for sending E-mail.

#### ID & Password

When the server requires authentication, ID and Password of an E-mail account need to be entered.

#### Destination Address

Enter Destination address. More than one address can be entered by delimiting comma (,) or semicolon (;). Destination address can take up to 63 characters.

#### E-mail Test

E-mail sending can be tested with this button. Please note that configured settings should be saved first by pressing **Apply** button before using E-mail Test function. One of the following messages will come as a result of the test.

Message⊷	Description 47
E-mail sent successfully∉	Test E-mail has been sent successfully. Reception in the client can be checked.
Failed to connect SMTP server <sup>2</sup>	Connection to the SMTP server failed. It is necessary to check if the server is reachable and server address and port are correct.
Authentication failed	The server is reachable but authentication failed. ID and/or password need to be checked.42
SMTP server rejected the mail+	The server is reachable, but mail sending failed due to a reason other than authentication. This error happens often when the server authenticates according to its own rule. For example, IP addresses of a specific range or addressed of a specific suffix are allowed.4 <sup>3</sup>

#### - E-mail Notification

#### > Video Clip Attaching

Video clip stored at the moment of event can be attached as an AVI or JPEG file format. When dual or quadruple encoding is enabled, **Primary video**, **Secondary video** (H.264 only) or **JPEG Capture** can be selected.

The number of JPEG frames is configured. This setting is applicable only when **JPEG Capture** is selected.

#### > Capture Interval

Select the interval of captured frame.

<u>FTP</u>

🍇 User 🛛 🕇		
🔁 System 🔸		

- Specify the information to upload event information, when FTP is selected as an event action.
- FTP
- Server Address

Enter an address of an RTP server to receive video files

Port

Specify a port for FTP operation (port 21 is the default port in FTP operation. If a different port is configured in the FTP server, this port needs to be changed accordingly.)

ID & Password

Enter ID and password for accessing the FTP server.

FTP file name

The names of files upload by FTP can be specified by the user. If a fixed name is specified, the file is overwritten repeatedly.

Max length of a file name is 60 characters. If the name is left blank, file name is determined according to the internal rule implemented in the firmware.

The following macros are supported to form variable parts of file names. The strings are case-sensitive. %YYYY : year

%MM : month %DD : day %hh : hour %mm : minute %ss : second %EVENT : event type (Sensor1, Motion, ...) %ADDR : address of the server (Domain name when DDNS is used. Otherwise IP address) ".avi" or ".jpg" will be added automatically at the end of the filename depending on the type of video file.

# > FTP Base Directory

Specify the name of the directory to be created in the FTP server. It is valid only when Use Record is set to Use on Record session.

# FTP Test

FTP upload function can be tested with this button. Please note that configuration settings should be saved first by pressing **Apply** button before using FTP test function. One of the following messages will appear as a result of the test.

Message↩	Description 43
FTP connection tested successfully	The connection to the FTP server is successful.
Failed to connect FTP server	The connection to the FTP server failed. It is necessary to check if the server is reachable and server address and port are correct.
Authentication failed	The server is reachable but authentication failed. ID and/or password need to be checked
Failed to upload file	File upload failed. The user of the ID is not allowed for writing into the directory or FTP server can be full.
Failed to erase file	Failed to delete the test file. The user of the ID doesn't have the privilege for file deletion.42

# - FTP Upload

Upload Video

Primary video and secondary, tertiary or quaternary video (H.264 only), JPEG capture can be selected for uploading.

> Number of Frame

Enter frame number of JPEG capture. (1 ~ 10)

Capture Interval

Select the interval of captured frame.

# Continuous Upload

Continuous upload 'ON' allows video clips to be transmitted regularly regardless of occurrence of event. When this mode is activated, FTP upload by event is suppressed.

Upload Duration

Specify recording duration of a video clip to be transmitted. (max 300 sec.)

Upload Interval

Specify transmission interval. (max 3600 sec.)

Upload duration is not included in upload interval. For example, if upload interval is 60 sec. and upload duration is 20 sec, a video clip for 20 sec is transmitted every 80 sec.

### - Local

When a decoder instead of a PC client is connected to an IP camera, one system becomes a Local system and the other a Remote system (Generally a system which is being used by the user is called a Local system). Then, actions for events can be configured for events from the remote system as well as for local system. For example, it is possible to turn on an alarm device in local (center) decoder system when a sensor device in remote (site) IP camera is triggered. **Local** section configures the actions for events from local (self) system, and configuration activates local devices and **Remote** sections configure the actions for events from remote (peer) system.

The following table lists the possible actions for events.

Action	Description
Веер	Triggers beep port.
Alarm out	Triggers alarm (relay) port.
E-mail	Sends E-mail to the specified address. AVI file can be attached
FTP	Upload AVI file to a specified FTP server
Preset	Move to the Preset position
Event OSD	Display OSD
Http Action	Transmit HTTP API

### - Sensor1 / Sensor2

ANTRICA

Configure the actions when the sensor is activated. Multiple actions can be set for a single event.

### - On Video Loss

encoders | decoders

Configure the actions when video input signal is lost. Multiple actions can be set for a single event.

### - On Motion

Configure the actions when motion is detected. Multiple actions can be set for a single event.

### - On Disconnect

Configure the actions when the link (connection) with peer system is disconnected. Multiple actions can be set for a single event. This event happens when the last client which has been receiving video from the camera loses the connection.

# Motion Detection

### - Use Motion Detection

Determine to use **Motion Detection** function.

### - Motion Detection Area Editing

Configure region for motion detection. Regions of arbitrary shape can be configured by the following steps;

# I. Select Enable on Edit tab.

- II. Select editing mode. **Set** is for including cells to motion detection region and **Erase** is for excluding.
- III. Select cells by right clicking. Multiple cells can be selected by pressing and dragging.
- IV. Press Apply Edit Area to save the setting.

### - Sensor Type

There are two sensor input ports on the video server. Each of the sensor ports can be configured to the followings;

Function	Operation
OFF	Not used
NO (Normally Open)	The port is normally open and activated when closed.
NC (Normally Closed)	The port is normally closed and activated when opened.

The function of the sensor port is set based on the type of the sensor connected.

### - Sensor Schedule

Choose **Sensor OFF** or **Sensor On** and click the below schedule table to make a sensor schedule according to day of week and hours.

Use record

- > Off: Recording function will not be used when "OFF" is selected.
- Use Disk : Use disk function will follow the setting of Schedule table which set as record off as a default.

- Select Video

Select video stream to record.

- Manual record

When On is selected, record is operated regardless of schedule.

- Overwrite

When the disk becomes full, the oldest data are deleted automatically. It is valid only when Use Record is set to Use disk.

- Max File Size / Max File Length

Max File Size option is for limiting the size of AVI file. If small file size is set, files of small size will be generated but numbers of the files will be increased. Max File Length option is for limiting the time length of AVI file. If the size of a file becomes Max File Size or the duration of the recording reaches Max File Length, a new file is created.

- Record File Format

Select file format, AVI or MP4.

- Automatically Backup to FTP

Data recorded in the disk can be uploaded to an FTP server automatically for backup. FTP server is configured on the Event page. It is valid only when Use Record is set to Use Disk.

### Checking status of recording

- Recording status can be checked on the main view page.

### - Event Type

Three recording modes are supported: Continuous, Event, Disconnect. In case of Event recording, event types can be selected among several events. Selected event type is used for configuring the schedule table. Up to 4 event types can be configured and each event type can be a combination of sensor, video loss and motion event.

Pre-event Time

Specify the duration of recording before an event happens.

Post-event Time

Specify the duration after the event is cleared

### - Schedule Table

Actual recording mode is determined by **Schedule Table**, where recording mode configured by day (of a week) and hour.

Each of recording modes configures the recording operation as follows:

Record Off

No recording in the schedule.

Continuous

Recording continuously

Disconnect

Recording is started when the system loses the connection to its last client (Decoder, VMS/NVR) etc. When there are multiple clients and one of the client is disconnected, this doesn't happen.

Event Type

Records when an event configured in Event Type setting happens.

- USB memory stick or USB HDD can be used, and at least 1GB size is recommended. Either EXT3 or FAT32 file system can be used. A disk with either EXT3 or FAT32 file system can be read in Linux PC. However, only disk with FAT32 file system can be read in Windows PC. Less than 4Mbps of video bit rate is recommended when you record and monitor video simultaneously since frame dropping may happen due to performance limitation.

- Be sure to restart the system after connecting USB memory stick or USB HDD.

During booting, the system reads status of disk and initializes it.

Once the initialization of a disk is finished, the status of disk is shown on **Record** page of web-based setup Refer to the chart for checking the status of disk.

Disk status⊷	Description.
Disk error detected₊ <sup>2</sup>	Error*
No disk ≁	Disk is not connected to the system.43
Searching Disk information↔	Checking the status of disk. Refresh the page and wait until the status is changed.42
Mounting and + <sup>J</sup> Recovering Disk+ <sup>J</sup>	Performing recovery process when disk damage is found. It takes from seconds to minutes for recovering.43
Disk format needed 🤟	Disk is attached, but the type of the file system is
Unknown disk type detected 🗧	unknown or damaged.42
USB Disk available↩	Available to be used for recording <sup>43</sup>
Disk removed ↩ or in abnormal state↩	Disk is detached during operation or there is damage on the file system. If it happens while disk is connected, it is recommended to format the disk. 43

- Recorded video and audio data can be saved as AVI or MP4 file format in the disk.

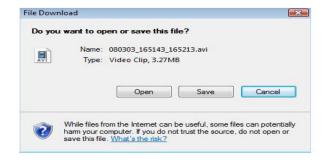

In general, one AVI file is created for an event in case of event-based recording. However, it is possible that recorded data by series of events happening continuously can be merged to a single AVI file depending on pre/post event time setting. The size of the file is limited to 10 ~ 2GB. In case of continuous recording, AVI files are created in series and the size of each is limited to 10 ~ 2GB.

# - Power Up Action

Specify if the camera will continue previous action such as pattern, swing or group after it is rebooted by power.

- Group-1: When it will reboot, start to Group-1
- Preset-1: When it will reboot, start to Preset-1
- > Off: Moves to the initial position after rebooting.

### - Motion Detection and Tampering disable on PTZ

User can disable Motion detection and tampering on PTZ

### - Auto Parking

Auto parking is a function to return to the previous preset position or to resume operation such as Pattern, Swing or Group when a specified time expires after user stopped PTZ control. Parking time can be set from 0 to 3600 seconds and "0" means that Auto Parking function is turned off.

• User List			
Login Policy		Login Failure Process	
👌 System	+	Number of Login failures Allowed No limit	Apply

### - Authentication Type

HTTP authentication based on RFC 2617(HTTP Authentication: Basic and Digest Access Authentication) is supported.

### - Skip Login

**Skip Login** provides for convenient access to the Video Server when authentication is not required. When Skip Login is set to **Enable**, login step is skipped.

### - Privilege Level After Login Skipped

The privilege level after login in this way is determined by the setting of **Privilege Level After Login Skipped**. If Privilege Level After Login Skipped is set as user, login in is not needed for user level's authority.

### **Authentication**

RTSP and HTTPAPI Authentication can be selected when client try to connect Video Server.

### Login Failure Process

### - Number of Login failures Allowed

Number of login failures is selected from no limit to 10 times and E-mail notification is available as well. Once number of login is full as selected, User ID is blocked as selected from 30 seconds to 5 minute.

• Log			

- Start Time

The latest the camera's booting date and time.

- Current Time

Current date and time.

Enter a new date and time then press Set Current Time button to update date & time.

### - Time Format

Change the time format. The selectable time formats are as below;

- I. YYYY/MM/DD hh:mm:ss (Eg. 2012/10.30 12:30:45)
- II. DD/MM/YYYY hh:mm:ss (Eg. 10/30/2012 12:30:45)
- III. MM/DD/YYYY hh:mm:ss (Eg. 30/10/2012 12:30:45)

### - Time Zone

Select time zone of where the camera is installed.

Depending on the time zone, Daylight Saving Time will work automatically

A **time zone** is a region of the earth that has uniform standard time, usually referred to as the **local time**. By convention, time zones compute their local time as an offset from UTC (Coordinated Universal Time). In casual use, GMT (Greenwich Mean Time) can be considered equivalent to UTC. Local time is UTC plus the current time zone offset for the considered location

### - Automatically synchronized with NTP server

Synchronize the camera time with an NTP server using NTP (network time protocol). Name of the NTP server should be registered on NTP server Name.

The **Network Time Protocol** (**NTP**) is a protocol for synchronizing the clocks of computer systems over packet-switched, variable-latency data networks. It is designed particularly to resist the effects of variable latency by using a jitter buffer.

<u>OSD</u>

# - System ID

Enter System ID that is used as a Video Server name.

The set System ID is displayed with video image on a Web Browser. The System ID is also transferred to remote software, such as VMS, and displayed on it.

### - BurnIn OSD

Insert system ID and date/time in the compressed video. System ID and time respectively can be turned on or off in the video. Position and Font size can be configured also. System ID for BurnIn OSD exists independently from normal System ID.

Note that size of Burnin OSD display varies according to the encoding resolution setting. This is inevitable because Burnin OSD is inserted to the frames before encoding is performed. The following table describes the rule for BurnIn OSD display.

Resolution∉ <sup>3</sup>	Small (8x8)↩	Middle (16x16)₽	Large (32x32)₽
352x480 / 352x240 / 352x576 / 352x288+2	2↩	<b>1</b> ₽	0⊷
720x480 / 720x240 / 720x576 / 720x288 /	2₽	20	<b>1</b> e
640x480 / 800x600↔			
1024 x 768 / 1280x720 / 1280 x 960 / 1280x1024 / 1440x900 / 1600x900 / 1680x1050 / 1920x1056 / 1920x1080 / 2048x1536 / 2560x1600 / 2592x19364 <sup>3</sup>	242	2₊₂	243

- 2 : Both System ID and Time are displayed
- 1 : Either System ID or Time can be displayed. When both are enabled, System ID is displayed.
- 0 : No items are displayed. This is because video area is too small to display OSD text in large text.

### - User defined OSD

You can enter any text you like independent.

- X-Coordinate or Y-Coordinate

For example, if you enter 500, 500 values, OSD is placed in center of images.

# - User-defined Bitmap OSD

OSD could be enabled or disabled while Bitmap image is uploaded in the video. X-Coordinate or Y-Coordinate can be adjusted according to values. Bitmap image could be uploaded.
